[AMI Labs](#), the world model startup launched by former Meta chief AI scientist Yann LeCun, has raised more than \$1 billion in its debut funding round.

At \$1.03 billion, the round is Europe's largest-ever seed deal and gives the Paris-based startup a reported pre-money valuation of \$3.5 billion. The round was led by a host of investors, including [Cathay Innovation](#), [Greycroft](#), [Hiro Capital](#), [HV Capital](#) and [Bezos Expeditions](#).

Several angels and corporates also supported the round, including [Mark Cuban](#) and [Nvidia](#), which has been spending increasing amounts of capital on AI startups such as [Nscale](#), which closed [Europe's biggest AI VC round](#) earlier this week.

by CEO Alexandre LeBrun, former head of healthtech startup [Nabla](#), AMI Labs is

already operating in Paris, New York, Montreal, and Singapore, despite the venture only being confirmed a few months ago.

LeCun, a Turing Prize winner, has long been critical of LLMs and their ability to achieve artificial general intelligence. He advocates, instead, for [world models capable of understanding physical spaces](#) by creating 3D interactive worlds within predefined parameters.

Proponents of world models argue that this path offers better applications in areas such as healthcare, robotics, and video games, owing to real-world simulations that are more suited for testing. AMI Labs has already agreed a partnership with Nabla to bring FDA-certifiable agentic AI systems to healthcare.

The space has received far less funding than LLMs, but investor appetite has been on the rise. Last month, AI pioneer Fei-Fei Li's [World Labs](#) raised \$1 billion from investors including Nvidia and Emerson Collective. In October, New York and Geneva-based [General Intuition](#) received \$134 million for its seed.
