Building Intelligent AI Systems that Understand the Real World: Our Investment in AMI Labs

3 min read · 18 hours ago

Advanced Machine Intelligence

Artificial intelligence is shifting from task automation to world interaction. This transition rests on two pillars: predicting the consequences of AI agents and continual learning in the real world. While Large Language Models (LLMs) revolutionized information, human-level intelligence will require a further leap that moves beyond predicting words to predicting outcomes.

At the center of this shift is the “[World Model](#),” an internal simulation of reality that allows a system to anticipate the consequences of its actions and solve tasks “[zero-](#)

shot.” Bridging the gap between digital prediction and physical reasoning is a massive scientific challenge. It requires an entirely new paradigm. That is why Toyota Ventures is excited to back AMI Labs, which is building the foundational intelligence necessary for physical reasoning.

Based in Paris, with locations in New York, Montreal and Singapore, AMI Labs is led by executive chairman Yann LeCun, a Turing Award winning pioneer widely recognized as one of the “godfathers of AI” and CEO Alex LeBrun, a serial entrepreneur whose previous company was acquired by Meta. Along with a global team of leading scientists and engineers with deep expertise in neural networks and machine intelligence, they bring a unique combination of scientific rigor and execution to the development of integrated, cognitive architectures.

“For AI to safely and effectively navigate the world of atoms as effectively as it navigates the world of bits, it requires more than a mastery of language — it requires a mastery of reasoning. Truly autonomous AI systems will be able to predict the results of their actions, continually learn, and even formulate original ideas. AMI Labs is building this AI reasoning foundation, and we’re thrilled to support them on their journey to deliver the next revolution of machine intelligence.”

— Jim Adler, Founder and General Partner, Toyota Ventures

AMI Labs’ mission to build intelligent systems that understand the real world is anchored in a long-term commitment to scientific and industrial advancement. Based on a framework called Joint Embedding Predictive Architecture (JEPA), the

company's approach focuses on internalizing the structure of the world through abstract representations, allowing the system to improve reasoning and prediction without needing to account for every detail. By learning concepts like cause-and-effect and spatial logic, these world models can move AI out of the digital sandbox and into real-world applications where reliability and safety are non-negotiable.

As part of AMI Labs' \$1.03B seed round co-led by Cathay Innovation, Greycroft, Hiro Capital, HV Capital, and Jeff Bezos Expeditions, Toyota Ventures co-seeded a Special Purpose Vehicle (SPV) with New Legacy Ventures. In connection with this investment, Toyota Ventures board member Dr. Gill Pratt will become a board observer for AMI Labs. Dr. Pratt, who has an extensive background in robotics and intelligent systems, also serves as the Chief Scientist and Executive Fellow for Research at Toyota Motor Corporation and CEO of Toyota Research Institute.

AMI Labs is focused on building the long-term infrastructure for real-world intelligence, and Toyota Ventures is proud to support the company on this journey. To learn more, visit [AMI's website](#) or the [Toyota Ventures portfolio page](#).
